

Jet Peel vs. Microdermabrasion

How Does Jet Peel Differ from Microdermabrasion?

Jet Peel	Microdermabrasion
<p>Jet Peel uses pressurised liquid to gently & hygienically exfoliate, but at the same time, cleanse & hydrate the skin.</p>	<p>Microdermabrasion works by using suction & fine crystals. The skin is sucked up & therefore dragged while the crystals act like sandpaper to exfoliate layers of the skin away. This method is very damaging & the skin is often grazed.</p>
<p>Jet Peel is a pleasant & relaxing experience for both the client and practitioner as the client enjoys the sound & the soothing coolness of the jets.</p>	<p>The treatment is highly uncomfortable as the client experiences an unpleasant scratching & dragging sensation. Both client & practitioner are also inhaling the harmful crystal particles & skin debris.</p>

How Does Jet Peel Differ from Microdermabrasion?

Jet Peel	Microdermabrasion
Jet Peel is a cold treatment & there is no contact or cross contamination. It is therefore suitable for even the most sensitive, Rosacea & Acne clients.	Microdermabrasion leaves the skin hot & as the skin is sucked inside the tube there is much cross contamination & cannot be used on sensitive, Rosacea or Acne clients.
Directly & immediately after treatment the skin is left renewed, hydrated, plumped, soothed, fresh, clean & invigorated.	Directly & immediately after treatment the skin is left dry, red, irritated & uncomfortable with debris remaining on the skin. Clients are told that they will see effects a few weeks later when the skin begins to heal itself- promoted by the damage caused.
